Password and MFA Security Guide

Protect every account with unique credentials and phishing-resistant verification.

Passwords

- Use a unique password for every account.
- Create long passphrases and store them in an approved password manager.
- Change a password immediately when exposure or reuse is suspected.

Multi-factor authentication

- Prefer passkeys or hardware security keys when available.
- Use an authenticator app when stronger options are not available.
- Never share one-time codes and never approve an unexpected prompt.

Recovery

- Store recovery codes offline in a secure location.
- Keep recovery email and phone details current.
- Remove old devices, sessions and unused application passwords.

Administrator accounts

- Use a separate privileged account for administration.
- Require stronger MFA and shorter sessions for privileged access.
- Review account activity and access rights regularly.

Use this guide with your organisation's policies and incident contacts. For urgent events, follow the approved escalation path immediately.
